## 1. GENERAL INFORMATION

### 1.1 Customer

YESPAN ELEKTRİK SAN. Ve TİC. LTD. ŞTİ.  
Aydın Organize Sanayi Bölgesi 2.Cadde No:41 Umurlu/AYDIN

### 1.2 Customer Representative

Serkan Üçgül - 3 Gül Danışmanlık Eğitim ve Belgelendirme Hizmetleri  
İvedik OSB. 1444. Sokak No:10 Kat:1 Yenimahalle/Ankara

### 1.3 Unit Under Test (UUT)

The test was performed on the following UUT:

- Description: YESPAN Outdoor Free Standing Type Modular Enclosure (Model Number: H Series, Serial Number: YDS22246-1)
- Dimensions: Width: 1200 mm, Depth: 800 mm, Height: 2200 mm
- Weight: 787 kg in total with 250 kg shelf weights.
- Geometry: The thickness of the frame and doors are 2.5 mm. The thickness of the covers is 2 mm.

Figure 1: YESPAN Outdoor Free Standing Type Modular Enclosure (Model Number: H Series, Serial Number: YDS22246-1)

**"Allianz Teknik" Allianz SE'nin tescilli bir markasıdır. Bu Rapor Allianz Teknik'in yazılı izni olmadan kopyalanamaz veya çoğaltılamaz. Belirtilen yönde görünen herhangi bir işlem gerekli yazılı izin olmaksızın geçersiz olacaktır. İmzasız ve kaşesiz raporlar geçersizdir. Bu rapor yalnızca rapor içeriğinde belirtilen test numuneleri için geçerlidir.**

"Allianz Teknik" is a registered trademark of Allianz SE. This Report cannot be copied or reproduced without Allianz Teknik's written permission. #### 1.4 Manufacturer

YESPAN ELEKTRİK SAN. Ve TİC. LTD. ŞTİ.  
Aydın Organize Sanayi Bölgesi 2.Cadde No:41 Umurlu/AYDIN

#### 1.5 Reference Documents

- EN/IEC 60068-3-3 : Environmental testing - Part 3-3: Supporting documentation and guidance - Seismic test methods for equipment
- EN 60068-2-6 : Environmental testing - Part 2-6: Tests - Test Fc: Vibration (Sinusoidal)
- EN 60068-2-47 : Environmental testing - Part 2-47: Tests - Mounting of specimens for vibration, impact and similar dynamic tests
- EN 60068-2-57 : Environmental testing - Part 2-57: Tests - Test Ff: Vibration - Time - history and sine - beat method

#### 1.6 Test Objective

The purpose of the tests were to demonstrate that UUT (unit under test) behave in compliance with the standard with parameter selections of "Zone 4"; "K=2" and Damping Ratio = %5. Please see section 2.4.2 of this report for details and standard suggestions for parameters.

#### 1.7 Overall Results

UUT provides the seismic criteria of TS EN/IEC 60068-3-3 standard. However, since there are no circuit breakers and busbars on the test sample, functional continuity checks as specified in the EN 60068-3-3 standard could not be performed and a criterion assignment to the test sample could not be performed.

#### 1.8 Testing Laboratory

Allianz Teknik Earthquake & Fire Testing and Training Center  
Türk-Alman Üniversitesi Şahinkaya Cd. No: 90, 34820 Beykoz/ İSTANBUL - TURKEY

#### 1.9 Test Date

October 4<sup>th</sup>, 2022

#### 1.10 Test Responsible & Visitors List

Erkan Özdağ, M.Sc. - Allianz Teknik Manager  
Volkan Ayık, M.Sc. - Allianz Teknik Earthquake Lab. Supervisor  
Berkay Aldırmaz, M.Sc. - Allianz Teknik Test Engineer  
Emin Karış - Allianz Teknik Laboratory Specialist  
Serkan Üçgöl - 3 Gül Danışmanlık

### 1.11 Distribution List

Serkan Üçgöl - 3 Gül Danışmanlık

### 1.12 Ambient Conditions

Temperature: 22.4°C

Humidity: 58% RH

### 1.13 Measurement Uncertainty

The Extended Measurement Uncertainty (U) value of the test system is 2.2% for the X, Y and Z axes.

### 1.14 Decision Rule

The decision rule was not applied.

### 1.15 Disclaimer

The report source test sample is evaluated as received by Allianz Teknik and the Report is created. Allianz Teknik is not responsible for the results of the test sample due to faulty, incorrect or non-production. Allianz Teknik does not accept any responsibility for the accuracy, completeness and being up-to-date of the information provided by an external party (Customer) and the effects of this information on the results of the Report.

## 2. TEST PROCEDURES

### 2.1 General Remarks

To perform the tests, three reference directions have been considered for the unit: X (front-rear), Y (side to side) and Z (vertical).

The sequence of the tests for UUT has been:

- Pre Test Functionality Control
- Vibration Response Investigation
- EN/IEC 60068-3-3 Earthquake (sequentially in X, Y, Z axis as 5S1 and 1 S2)
- Functionality Control During Test
- Post Vibration Response Investigation
- Post Test Functionality Control

### 2.2 Mounting Techniques

- UUT was mounted in accordance with EN/IEC 60068-2-47 for all tests.
- UUT was connected to the base under it with totally 12 M10 bolts. These bolts were welded bolts. The base was attached to the adapter fixture under a total of 12 M10 bolts (See Picture 6).
- The adapter fixture of the UUT was fixed to the MAST by torqued to 80 Nm with 16 M12 bolts. (See Picture 8 and Picture 16).

### 2.3 Control and Measuring Position

The signals of accelerometers integrated to MAST were used for the motion control. In the table below, model and serial number of the sensors mounted in the control and measuring positions are summarized.

Brand	Description	Serial Number	Calibration Due Date
MTS	353.20 MAST	EQ1-001	NA
HBM	eDAQXR	EQ4-001-E1&E2	22.06.2023
PCB	Accelerometer	12509	06.01.2023
PCB	Accelerometer	12511A	06.01.2023
PCB	Accelerometer	12512	06.01.2023
PCB	Accelerometer	12513	06.01.2023
PCB	Accelerometer	12525A	05.01.2023
PCB	Accelerometer	12526A	06.01.2023
PCB	Accelerometer	12527A	06.01.2023
PCB	Accelerometer	12528	06.01.2023
PCB	Accelerometer	12529	06.01.2023
Dytran	Accelerometer	7603D4	05.01.2023
Dytran	Accelerometer	1117	15.03.2023
Dytran	Accelerometer	1114	15.03.2023

Table 1. Test Equipment & Sensors

*"Allianz Teknik" Allianz SE'nin tescilli bir markasıdır. Bu Rapor Allianz Teknik'in yazılı izni olmadan kopyalanamaz veya çoğaltılamaz. Any such purported operation shall be void without such written consent. Reports without signature and stamp are not valid. This report is valid exclusively only for mentioned test samples.

Figure 2. Accelerometer locations on UUT

Acc No	Location	Description
1114	1	Bottom of UUT
1117	2	COG (center of gravity) of UUT
7603D4	3	Top of UUT

Table 3. Accelerometer location descriptions

Measurements were recorded from the points shown in Figure 2 on the UUT as stated in 3.2 measuring points section of EN 60068-2-6. In addition to these points, a total of 9 unidirectional accelerometers integrated into the MAST table were used to comply with 3.2.3 of the same standard. In accordance with the imaginary reference point section, tests were carried out with respect to an imaginary point on the midpoint of MAST table surface. This imaginary reference point was calculated by the test software for each axis as "Observed Acceleration".

**"Allianz Teknik" Allianz SE'nin tescilli bir markasıdır. Bu Rapor Allianz Teknik'in yazılı izni olmadan kopyalanamaz veya çoğaltılamaz. Belirtilen yönde görünen herhangi bir işlem gerekli yazılı izin olmaksızın geçersiz olacaktır. İmzasız ve kaşesiz raporlar geçersizdir. "Allianz Teknik" is a registered trademark of Allianz SE. This Report cannot be copied or reproduced without Allianz Teknik's written permission. Any such purported operation shall be void without such written consent. Reports without signature and stamp are not valid. This report is valid exclusively only for mentioned test samples.

Tests were carried out by providing control as stated in the multiple reference control section referring to 4.2.2 in the 4.2 Control Method section of the EN 60068-2-6 standard.

## 2.4 Seismic Tests

### 2.4.1 Vibration Response Investigation

The aim of the tests was to define the resonance frequencies of UUT.

For this purpose, MAST (Please see Section 3.1) was vibrated with an excitation of “sinusoidal sweeping” type varying the frequency between 1 Hz to 35 Hz with a speed of 1 octave per minutes, maintaining the acceleration level of 0,1 g.

Damping ratio was calculated by the “Half Power Bandwidth” method, from the transmissibility function of the accelerometer located close to center of gravity of UUT according to EN/IEC 60068-3-3.

$$\beta (\%) = (F_2 - F_1) / 2F_r$$

$F_r$  = Resonance frequency

$F_1$  = The first frequency value at intersection of 3dB ( $\sqrt{2} = 1,414$ ) band of the amplitude

$F_2$  = The second frequency value at intersection of 3dB ( $\sqrt{2} = 1,414$ ) band of the amplitude

Figure 3. Half Power Bandwidth Method

### 2.4.2 EN/IEC 60068-3-3

To generate RRS (required response spectrum), criteria below mentioned should be determined by test requester:

#### 1. Zone selection

This selection is needed to determine ground acceleration and zero period acceleration (ZPA) of the spectrum.

Zone is about geographical location and site ground conditions.

Seismic Activity Zone	Zone 0	Zone 1	Zone 2	Zone 3	Zone 4
Ground Acceleration (g)	0	0.1	0.2	0.3	0.5

Table 4. Seismic activity zone

“Allianz Teknik” Allianz SE’nin tescilli bir markasıdır. Bu Rapor Allianz Teknik’in yazılı izni olmadan kopyalanamaz veya çoğaltılamaz. Belirtilen yönde görünen herhangi bir işlem gerekli yazılı izin olmaksızın geçersiz olacaktır. İmzasız ve kaşesiz raporlar geçersizdir. Bu rapor yalnızca rapor içeriğinde belirtilen test numuneleri için geçerlidir.

“Allianz Teknik” is a registered trademark of Allianz SE. This Report cannot be copied or reproduced without Allianz Teknik’s written permission. Any such purported operation shall be void without such written consent. Reports without signature and stamp are not valid. This report is valid exclusively only for mentioned test samples.

Zone is selected as **Zone 4** by the test requester.

## 2. Superelevation factor (K) selection

Superelevation factor amplifies (K factor) the ground acceleration. This value is determined according to installation type of UUT in service condition.

K factor is selected as **2** by the test requester.

K factor	Application
1	Mounting of equipment on rigid foundations or on structures of high rigidity
1,5	Installations rigidly connected to buildings
2	Installations on stiff structures connected rigidly to buildings
3	Installations on low rigidity structures connected to buildings

Table 5. K factor

## 3. Damping Ratio Selection

Damping ratio of the equipment lie generally between %2 to %10 (Section 14).

Damping ratio is selected as **%5** by the test requester as suggested in standard in Section 9.4.

According to these selections, calculations are made and RRS shape below is assigned with numbers.

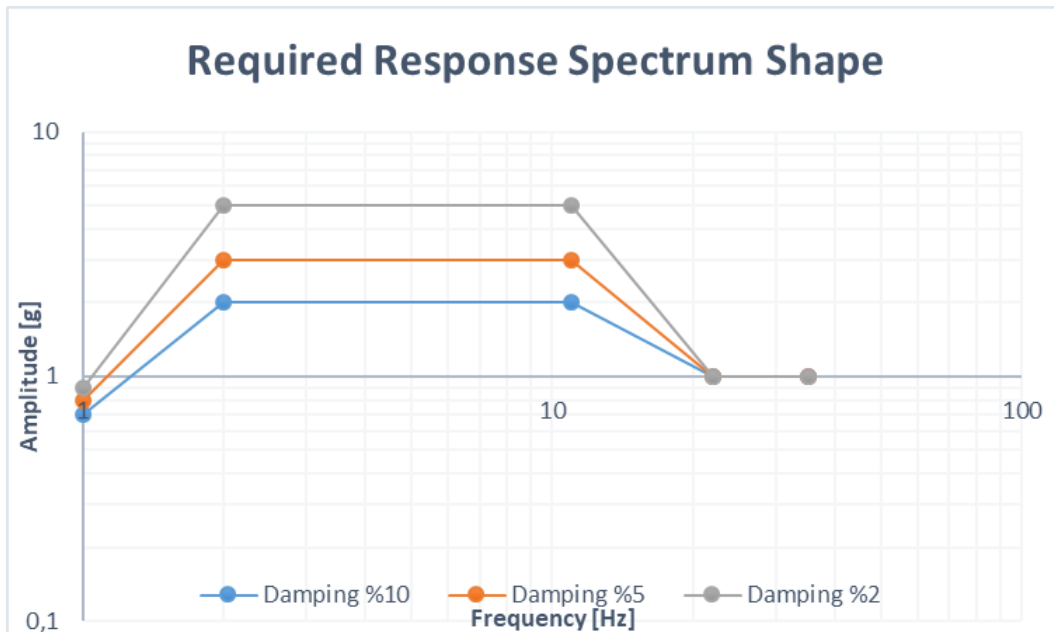

Figure 4. RRS shape

### 3. TEST EQUIPMENT

#### 3.1 Multi Axial Simulation Table (MAST)

- The test have been performed on MAST system, which is 6 DOF capability (Figure 6).
- The shaker table powered by six servo hydraulic actuator, all of them mounted the table with 120°.
- Each actuator has a maximum 70,6 kN peak force and maximum displacement of 145mm on Z axis, 115 mm on Y axis and 130 mm on X axis.
- The hydraulic pump has 5 engines with a total power 225 KW. It is capable of pumping a flow up to 600 l/min at a working pressure of 210 bars.

Figure 6. Multi Axial Simulation Table (MAST)

#### 3.2 Sensors

Accelerometers employed during the tests are listed below:

Dytran 7603D4

- Uni axial
- Acceleration Measurement Range  $\pm 25$  g
- Frequency Response 0-1400 Hz

Dytran 1114

- Uni axial
- Acceleration Measurement Range  $\pm 40$  g
- Frequency Response 0-1500 Hz

***“Allianz Teknik” Allianz SE'nin tescilli bir markasıdır. Bu Rapor Allianz Teknik'in yazılı izni olmadan kopyalanamaz veya çoğaltılamaz. Belirtilen yönde görünen herhangi bir işlem gerekli yazılı izin olmaksızın geçersiz olacaktır. İmzasız ve kaşesiz raporlar geçersizdir. Dytran 1117

- Uni axial
- Acceleration Measurement Range  $\pm 40$  g
- Frequency Response 0-1500 Hz

PCB 3471M39 model accelerometers integrated to MAST:

- Uni axial
- Acceleration Measurement Range  $\pm 30$  g
- Frequency Response 0-1500 Hz

### 3.3 Data Acquisition Equipment

During the tests, the shaker was controlled by a computer-based system, which is MTS RPC Pro and Flex Test controller.

Figure 7. EDAQXR Datalogger

### 3.4 Measurement Uncertainty

The measurement uncertainty of the test system was calculated according to FR0601 Earthquake Laboratory Measurement Uncertainty Calculations Registration Form.

The combined uncertainty value ( $U_c$ ) was calculated from the measurement uncertainties of type A ( $U_A$ ) and type B ( $U_B$ ). This value was expanded by 2 to find the Extended Measurement Uncertainty ( $U$ ) value.

The Extended Measurement Uncertainty ( $U$ ) value of the test system is 2.2% for the X, Y, and Z axes.

*“Allianz Teknik” Allianz SE'nin tescilli bir markasıdır. Bu Rapor Allianz Teknik'in yazılı izni olmadan kopyalanamaz veya çoğaltılamaz. Belirtilen yönde görünen herhangi bir işlem gerekli yazılı izin olmaksızın geçersiz olacaktır. İmzasız ve kaşesiz raporlar geçersizdir. Bu rapor yalnızca rapor içeriğinde belirtilen test numuneleri için geçerlidir.*

“Allianz Teknik” is a registered trademark of Allianz SE. This Report cannot be copied or reproduced without Allianz Teknik's written permission. Any such purported operation shall be void without such written consent. Reports without signature and stamp are not valid. This report is valid exclusively only for mentioned test samples.

#### 4. TEST DATA SPECIFICATIONS

Seismic tests were performed by applying an artificial time history obtained from Required Response Spectrum (EN/IEC 60068-3-3).

Test response spectrum (TRS) should envelope required response spectrum (RRS) throughout the test frequency bandwidth. TRS should not be greater than 50% of the RRS across the spectrum according to EN 60068-2-57 Section 4.4.4. However, above  $1/3 f_2$  (11 Hz), this ratio can be exceeded. On the other hand, small number of points can be moved outside of this tolerance range below  $1/3 f_2$ , which should not be a problem as long as they do not coincide with the resonant frequency of the UUT. The TRS reached in the test meets these specifications. See. Page 13-14.

Seismic tests were performed in three axes and sequentially referring to EN 60068-3-3 12.2 Testing Conditions.

Tests were applied as 5 times of S1 and 1 time of S2 earthquakes.

S1 earthquake is to demonstrate that low intensity earthquakes, which have the highest possibility of occurring, are not detrimental to functional safety of the performance of the equipment, and that fatigue or ageing condition is not generated.

S2 earthquake is to demonstrate that high intensity earthquakes, which could lead to defective performance.

S2 earthquake should 2 times of S1 in amplitude.

Seismic test data duration should be minimum 30 seconds with 20 seconds of strong part. Strong part starts at the moment which the amplitude of data is observed as %25 of the maximum peak-to-peak value through all data. Strong part lasts when the amplitude of the data decreases less than %25 of the maximum peak-to-peak value through all data.

The transverse motions should be less than 25% of the amplitude of main motions (the axis on which the test is applied) during seismic tests. This has provided. Please see page 20-21.

## 6. RESONANCE INVESTIGATION RESULTS

After resonance investigations applied with sine sweeps, result table is below:

UUT Resonance Frequency Table					
Sequence	Acc No	UUT	Resonance Frequency [Hz]		
		Description	Front-to-Back	Side-to-Side	Vertical
Pre Test	1114	Bottom	-	-	-
	1117	COG	7,56	7,32	-
	7063D4	Top	7,56	7,32	-

Table 7. UUT resonance frequencies before test

UUT Resonance Frequency Table					
Sequence	Acc No	UUT	Resonance Frequency [Hz]		
		Description	Front-to-Back	Side-to-Side	Vertical
Post Test	1114	Bottom	-	-	-
	1117	COG	4,51	4,15	-
	7063D4	Top	4,51	4,15	-

Table 8. UUT resonance frequencies after test

Front-to-Back direction of UUT is X axis of test equipment (MAST)

Side-to-Side direction of UUT is Y axis of test equipment.

Vertical direction of UUT is Z axis of test equipment.

The changes of the first natural frequencies between before and after the test are represented:

- 40% decrease was observed on the X axis.
- 43% decrease was observed on the Y axis.
- No change on the Z axis.

These observations do not affect pass/fail criteria of the test standard. Table 9 shows the calculated damping parts of the general natural frequencies of the UUT. In these calculations, the accelerometer data at the top of the UUT is used.

UUT directions	MAST directions	Damping Ratio	Damping Ratio
		Pre Test	Post Test
Front-to-Back	X	4%	2%
Side-to-Side	Y	2%	3%
Vertical	Z	-	-

Table 9. Damping ratios calculated with Half Power Bandwidth Method according to EN/IEC 60068-3-3

## 9. CONCLUSION

After the test,

- Plastic deformation was not observed on UUT.
- Side and back covers of UUT were still engaged.
- Doors of UUT were still engaged and could operate as intended.
- Connections and fasteners inside UUT completed the test in the assembled condition without any loss of torque.
- No torque loss was observed on fasteners between MAST and UUT.

UUT provides the seismic criteria of TS EN/IEC 60068-3-3 standard. However, since there are no circuit breakers and busbars on the test sample, functional continuity checks as specified in the EN 60068-3-3 standard could not be performed and a criterion assignment to the test sample could not be performed.

According to Section 4.4 – Qualification Criteria, UUT is assigned as following classes:

1. Criterion 0: Equipment (UUT) subjected to seismic testing which experienced no malfunction either during or after the test.
2. Criterion 1: Equipment subjected to seismic testing which suffered a malfunction during the test but reverted to its correct state after the test.
3. Criterion 2: Equipment subjected to seismic testing which experienced a malfunction during the test and required resetting or adjustment on completion of the test but required no replacement or repair.
